SUMMARY

Third-year Computer Engineering undergraduate at Myongji University with a strong interest in AI/ML, especially in optimizing and downsizing large language models (LLMs) for local deployment. Currently learning TensorFlow, PyTorch, and Rust to deepen technical understanding in these areas. Grateful and excited to be born in an era of rapid technological advancement, where learning and building are more accessible than ever. Aspiring to create products that people will find genuinely useful in their daily lives, taking steady steps toward that goal.

EXPERIENCE

- 06/2024 - 08/2024

Seoul

●

NIPA-Google ML Bootcamp Collaborative Practical Project

Project: InTheView

Developed and fine-tuned a model for generating and evaluating interview questions; awarded the Encouragement Prize as a team.
- 12/2021 - 09/2023

Osan Air Base

●

Republic of Korea Air Force

Sergeant (Class 833) | Security System Management

Responsible for the maintenance and repair of various cryptographic devices, as well as the creation and decryption of encrypted messages. Also served as the dormitory leader, representing and supporting approximately 40 fellow soldiers.

EDUCATION

- 03/2021 - 02/2027

●

Bachelor of Computer Engineering

Myongji University

SKILLS

Python Typescript C++ Git Next.js Nest.js TensorFlow PyTorch

PROJECTS

- [MCP] Atom of Thoughts

03/2025 - 04/2025

This project leverages the Model Context Protocol to enable an LLM to decompose complex problems into independent atomic units of thought, utilizing the dependencies between these units to deliver more robust reasoning and validated insights.

 - I've always wanted to create useful features that genuinely satisfy people, and this was the first project where I received GitHub stars from people I didn't know — which made it personally meaningful. I was also very satisfied with the results when testing it with tools like Claude and Cursor AI.
- HomeRun

09/2024 - 12/2024

This project provides transportation information between Myongji University and nearby subway stations. I developed a machine learning model to predict shuttle bus arrival times between the campus and stations, and also built the server using Nest.js.

 - Although I had to discontinue the service due to cost issues, I personally found it useful for commuting to and from school. I was also pleased to hear from people around my university that it helped them with their daily commute.
- InTheView

07/2024 - 08/2024

This project is a mock interview website. I developed a model and fine-tuned it using approximately 60,000 interview data entries to generate expected interview questions and evaluate user responses.

 - This project was carried out as part of the 'NIPA-Google ML Bootcamp Practical Project,' where it was awarded an Encouragement Prize. It was my first experience building a model based on real-world data and performing fine-tuning, and I consider it a successful learning experience.

COURSES

- [Coursera] Foundations of Data Science

Explatory Data Analysis
- [Coursera] The Power of Statistics
- [Coursera] Go Beyond the Numbers: Translate Data into Insights

pandas, numpy
